At some point, I want to set up a shop.

I've already written a script that can make customized models using image files as input. What I'm wondering is how can I allow the person that would be letting me use their image to see the model and buy the model while hiding the customized model from other users. I want to be able to make customized models that can only be sold and shown to the person that I'm working with. Any advice would be greatly appreciated.

Simply leave the checkbox "Display to Public" turned OFF and then send the URL of the model directly to customers you DO want to have access.

I would recommend using the "Pemralink" URL.. it is a whole lot easier to work with.
