I'll be placing my first order over the weekend after some intense scrutiny and double checking of all my clearances.

It's a tiny little bugger. just over 2" in diameter at the base. you might say it's life sized, depending on the species of dragonfly.

Below is a little still image of it.

There's also a video i put on youtube of what it *should* do when you turn the gear.

The gear case at the bottom is a snap fit with some prongs.

The wings are driven up by the pistons, and hopefully are heavy enough to fall back down under their own weight without binding up.

I always post about what i'm doing on my blog if anyone is interested.

It hasn't been around long. Only since I stumbled upon shapeways.

I'm amped though. I can't wait to get this thing!!

I hope so much that it works as expected!

Any feedback would be great. It is my first order. So, If I made any obvious mistakes. I would like to fix them before I actually place the order tomorrow.

Thanks!

Rith

Wow. Very nice.

You must post pics when it arrives.
