Hi,

I'm building a little test object (in Rhino) to see how precise my parts come out. Some testing for more complex objects in the future

It's a ring split in two, and should be able to be connected with two screws. Will the silver and/or stainless steel print be accurate enough for these parts to fit? I worked with booleans.

And how about orientation? What's the best orientation and layout to submit this file?

Thanks in advance

The parts should come out exact. If not, call their customer support.

Orientation is not important, as they will decided the best way to position it prior to printing.
