---

I am making a model of a ring with sprues and a pouring button. This will have investment poured over and around it and then placed in a kiln to burn the positive out leaving space for casting metal to be poured in.

What I am wondering is what would be the best material to get printed i and what kind of temperatures are we talking about being necessary?

Thanks in advance.

Oli

I know WSF has been used for this before, do a search in the post production section to find more.

Hey oliverashford,

Just wanted to let you know: WE PRINT WAX NOW!

Have fun,  
Natalia
