Are there any other restriction for an empty space inside model?

i know that escape holes need to be at least $d=2\text{mm}$ (4mm). My question is if all "walls" need to be 2mm or not? (mine have 1,2mm)

i have designed object for cutting hole with boolean but i have no good place for escape holes other than they are on picture. Problem can be that most unused material is on the other side of model.
