Hello,

I need someone to help me make a holster clip adapter where these Ryobi batteries (found from Home depot) clip into each other as seen in picture

It must be able to maintain enough room and functionality where the electrical terminals make proper contact.

Pls don't make this more complicated then it is. The batteries in the picture are laid out exactly how I want it to clip into each other. Just fill in the space between the battery with the housing that I need for you to design.

must be willing to sign an NDA

Thanks,
Mike
