I'm designing this steampunk-styled submarine in Blender. I still need to add some portals, lights and maybe more rivets. And I need to figure out how I'm going to make the model stand on a flat surface.

How about a small tray filled with sand, sub resting on the seabed ?

I didn't think of that. I will model some variations to see how it looks.

Since I'm planning on printing the model in sandstone, I have to put some big holes at the bottom. So I've decided to add some legs for the model to stand on which will hide the bottom holes from view.
