
Subject: Option to use statcounter.com tracking code instead of GG analytics ?

Full referrer URL tracking doesn't work for me on Analytics, even using the well-documented hack (well in fact there are two, but I could only try one because the other involves changes in the tracking javascript).

Statcounter, on the other side displays the full referrer by default.

Thanx fx!

I'm going to forward this to the right people.. maybe we can work something out for you guys with statcounter

bump: one year later The referer tracking of incoming traffic problem is still there. In GG Analytics, there is a kind of a "hack" that kinda works (I'm using it). GG analytics is not giving the full url for: Facebook, most forums, most big websites...

Shapeways Staff: Could you explain how I should set up analytics to precisely track(down to the web page) incoming traffic ? Thank you !
