Hi Shapeways fans,

Oskar's Magic: a solid 3mm metal rod can slide (almost) effortlessly through the block. How can that be?

The mechanism for this puzzle is related to the ancient Heron's Horse, where the magician slices a sword through the neck of a horse statue without the head falling off. However, whereas Heron's mechanism (see page 109) uses rotors, Oskar's mechanism features meshing gears. The result is less friction and a smoother cut.

Watch the YouTube video.

Buy the magic at my Shapeways Shop.

Read more at the Non-Twisty Puzzles Forum.

Check out the photos below.

Enjoy!

Oskar

Very impressive, Oskar!  
I did not know the Heron's Horse mechanism either.  
This is very instructive.  
Thank you for sharing.

Great job, Oskar!! It does look like a magic trick. I guess you could even have up to three rods descending in the gears at the same time. As long as each one stayed in its special slot.

Heron's mechanism with the horse drinking afterwards is amazing! Especially given the state of metallurgy, let alone 3D printing, 2000 years ago.
